SUBJECT: Tanner Lake Dam Phase I Inspection Report

This report presents the results of field inspection and evaluation of the Tanner Lake Dam (MO 11230).

It was prepared under the National Program of Inspection of Non-Federal Dams.

This dam has been classified as unsafe, non-emergency by the St. Louis District as a result of the application of the following criteria:

- a. Spillway will not pass 50 percent of the Probable Maximum Flood without overtopping the dam.
 - b. Overtopping of the dam could result in failure of the dam.
- c. Dam failure significantly increases the hazard to loss of life downstream.

PHASE I REPORT NATIONAL DAM SAFETY PROGRAM ASSESSMENT SUMMARY

Name of Dam State Located County Located Stream Date of Inspection Tanner Lake Dam Missouri Ray County Tributary to Cravens Creek July 2, 1980

Tanner Lake Dam was inspected by an interdisciplinary team of engineers from Hoskins-Western-Sonderegger, Inc. The purpose of the inspection was to make an assessment of the general conditions of the dam with respect to safety, based upon available data and visual inspection, in order to determine if the dam poses hazards to human life or property.

The guidelines used in the assessment were furnished by the Department of the Army, Office of the Chief of Engineers and developed with the help of several Federal and State agencies, professional engineering organizations, and private engineers.

Tanner Lake Dam has a height of twenty-nine (29) feet and a storage capacity at the minimum top elevation of the dam of one hundred-five (105) acre-feet. In accordance with the guidelines, a small size dam has a height greater than or equal to twenty-five (25) feet but less than forty (40) feet and a storage capacity greater than or equal to fifty (50) acre-feet but less than one thousand (1,000) acre-feet. The size classification is determined by either the storage capacity or height, whichever gives the larger size category. Tanner Lake Dam is classified as a small size dam.

In accordance with the guidelines and based on visual observation, the dam is classified as having a high potential for damage and loss of life. Failure would threaten life and property. The estimated damage zone extends approximately three (3) miles downstream of the dam. Within the damage zone are a dwelling and a building (0.7 miles downstream), three dwellings and two barns (2.7 miles downstream), and seven dwellings and a house trailer (2.9 miles downstream).

Our inspection and evaluation indicate that the spillways do not meet the minimum criteria set forth in the recommended guidelines for a small dam having a high hazard potential. In consideration of the small volume of water impounded and the size of the downstream floodplain 50 percent of the Probable Maximum Flood is the appropriate spillway design flood. The spillways will pass the 100-year flood (a flood having a l percent probability of being exceeded in any year) without overtopping the dam. The spillways will pass 20 percent of the Probable Maximum Flood without overtopping the dam. The Probable Maximum Flood (PMF) is defined as the flood that may be expected from the most severe combination of critical meteorologic and hydrologic conditions that are reasonably possible in the region.

Design data was available for this dam from the Soil Conservation Service. Based on the design data and the field inspection of the dam the following remedial measures should be implemented by the owner on a high priority basis:

- a. All trees and brush should be removed from the embankments and crest of the dam and from the emergency spillway.
- b. Following the removal of trees and brush from the dam and the emergency spillway another inspection based on the "Recommended Guidelines for Safety Inspection of Dams" should be made. Remedial measures that may become apparent based on this inspection, and which are not covered in this report should be incorporated in the work to be done by a professional engineer.
- c. The spillway size and/or the height of the dam should be increased in order to pass 50 percent of the probable maximum flood without overtopping the dam. Spillway capacity could be increased either by enlarging the existing emergency spillway or by construction of an additional spillway through the left abutment.

The following operation and maintenance procedures are recommended and should be implemented by the owner:

- a. Seepage and stability analyses comparable to the requirements of the recommended guidelines should be performed by an engineer experienced in the design and construction of dams.
- b. After the remedial measures recommended above are accomplished a program of periodic inspection and regular maintenance should be initiated in order to control tree and brush growth and to make minor repairs.
- c. Records of inspections should be made a part of this project file.

PHOTO NO. 1 - OVERVIEW

PHASE I INSPECTION REPORT NATIONAL DAM SAFETY PROGRAM TANNER LAKE DAM - MO 11230 RAY COUNTY, MISSOURI

SECTION 1 - PROJECT INFORMATION

1.1 GENERAL

- a. Authority. The National Dam Inspection Act, Public Law 92-367 authorized the Secretary of the Army through the Corps of Engineers, to initiate a program of safety inspection of dams throughout the United States. Pursuant to the above, the St. Louis District, Corps of Engineers, District Engineer directed that a safety inspection of Tanner Lake Dam be made.
- b. Purpose of Inspection. The purpose of the inspection was to make an assessment of the general condition of the dam with respect to safety, based upon available data and visual inspection, in order to determine if the dam poses hazards to human life or property.
- c. Evaluation Criteria. Criteria used to evaluate the dam were furnished by the Department of the Army, Office of the Chief of Engineers, in "Recommended Guidelines for Safety Inspection of Dams", Appendix D to "Report of the Chief of Engineers on the National Program of Inspection of Dams," dated May, 1975, and published by the Department of the Army, Office of the Chief of Engineers.

1.2 DESCRIPTION OF PROJECT

- a. Description of Dam and Appurtenances.
 - (1) The dam is an earth fill approximately 700 feet in length and 29 feet high. The maximum water storage at the minimum top elevation of the dam is 105 acre-feet. This site is located in the rolling loess-till hill area north of the Missouri River. Minimal design assistance was provided by the Soil Conservation Service, Richmond, Missouri under the Public Law 46 program for dam ponds, gully control and other small dams partially funded by ASCS.
 - (2) The principal spillway is uncontrolled and consists of a 20-inch diameter welded steel pipe that passes through the dam. The inlet end is equipped with a hood.
 - (3) An uncontrolled, vegetated earth emergency spillway is cut through the right abutment. It has a bottom width of about 30 feet and side slopes of 1V on 3H.

- (4) Pertinent physical data are given in paragraph 1.3 below.
- b. Location. The dam is located in the south central portion of Ray County, Missouri, as shown on Plate A-2. The dam is shown on Plate A-1 in the SW4 of Section 10, T51N, R28W.
- c. Size Classification. Criteria for determining the size classification of dams and impoundments are presented in the guidelines referenced in paragraph 1.1c above. Tanner Lake Dam has a height of 29 feet and a storage capacity of 105 acre-feet. This dam is classified as a small size dam. A small size dam has a height greater than or equal to 25 feet but less than 40 feet and a storage capacity greater than or equal to 50 acre-feet but less than 1,000 acre-feet. The size classification is determined by either the storage or height, whichever gives the larger size category.
- d. Hazard Classification. Guidelines for determining hazard classification are presented in the same guidelines as referenced in paragraph 1.1c above. Based on referenced guidelines, this dam is in the High Hazard Potential Classification. The estimated damage zone extends about three miles downstream of the dam. Within the damage zone are a dwelling and a building (0.7 mile downstream), three dwellings and two barns (2.7 miles downstream), and seven dwellings and a house trailer (2.9 miles downstream).
- e. Ownership. The dam is owned by Mr. Oswald A. Tanner, Rt. #2, Richmond, Missouri 64085.
- f. Purpose of Dam. The dam was constructed for erosion and gully control.
- g. Design and Construction History. The dam was surveyed and designed by the Soil Conservation Service, Richmond, Missouri. It was reported by Mr. Tanner that he began construction of the dam in 1966. The principal spillway pipe was laid and the dam built up to the main hollow or stream. The main core was left open over the valley. Mr. Tanner was unable to finish the dam the following years due to his own personal work and wet weather. Finally, a friend of Mr. Tanner's finished the construction of the dam in 1974.
- h. Normal Operating Procedure. There are no operating facilities for this dam. The pool level is controlled by rainfall, infiltration, evaporation, and the capacity of the uncontrolled spillways.

1.3 PERTINENT DATA

a. Drainage Area. 165 acres (0.258 square miles).

b. <u>Discharge at Damsite</u>.

- (1) All discharges at the damsite are through a 20-inch welded steel pipe with hooded inlet and through an uncontrolled, vegetated earth emergency spillway.
- (2) Estimated maximum flood It was reported by Mr. Tanner that water flowed through the emergency spillway in the spring of 1975 due to the principal spillway being plugged with ice. Depth of water in the spillway at that time is not known.
- (3) The principal spillway capacity varies from 0 c.f.s. at elevation 100.4 feet to 48 c.f.s. at the crest of the emergency spillway (elevation 103.4 feet) to 50 c.f.s. at the minimum top of dam (elevation 105.4 feet).
- (4) The emergency spillway capacity varies from 0 c.f.s. at its crest (elevation 103.4 feet) to 260 c.f.s. at the minimum top of dam (elevation 105.4 feet).
- (5) Total spillway capacity at the minimum top of dam is 310 c.f.s. ±.

c. Elevations (feet).

- (1) Observed pool 98 ±
- (2) Normal pool 100.4
- (3) Spillway crest (s)

Principal - 100.4

Emergency - 103.4

- (4) Maximum experienced pool 103.4 +
- (5) Top of dam (minimum) 105.4
- (6) Maximum Tailwater Unknown
- (7) Streambed at Centerline 76 ±

d. Reservoir.

- (1) Length (feet) of pool at top of dam 1,400 +
- (2) Length (feet) of pool at principal spillway crest 1,000 +
- (3) Length (feet) of pool at emergency spillway crest 1,240 ±

- e. Storage (Acre-feet).
 - (1) Observed pool 54 ±
 - (2) Normal pool 65 ±
 - (3) Spillway crests

 Principal 65 ±

 Emergency 87 ±
 - (4) Maximum experienced pool 87 +
 - (5) Top of dam (minimum) $105 \pm$
- f. Reservoir Surface (Acres).
 - (1) Observed pool 5.7 ±
 - (2) Normal pool 6.8
 - (3) Spillway crests
 Principal 6.8
 Emergency 8.2
 - (4) Maximum experienced pool 8.2 +
 - (5) Top of dam (minimum) -9.3 +
- g. Dam.
 - (1) Type Earth fill
 - (2) Length 700 feet
 - (3) Height 29 feet +
 - (4) Top width 12 feet +
 - (5) Side slopes.
 - (a) Downstream 1V on 2H (plans); 1V on 3H (field measurement)
 - (b) Upstream 1V on 3H (plans); 1V on 4H (field measurement)
 - (6) Zoning None

- (7) Impervious core Homogeneous section
- (8) Cutoff 10 ft. bottom width with IV on IH side slopes and varying in depth from 4 to 10 ft. (plans). Mr. Tanner said the core bottomed in clay.
- (9) Grout curtain None
- (10) Wave protection Vegetated berm, 8 ft. wide
- (11) Drains None
- h. Diversion Channel and Regulating Tunnel. None
- i. <u>Spillway</u>.
 - (1) Principal
 - (a) Type Uncontrolled, 20-inch diameter welded steel pipe with hooded inlet and anti-vortex device passing through the embankment.
 - (b) Crest (invert) elevation 100.4

 Outlet 77.5
 - (c) Length 98 ft. ±
 - (2) Emergency
 - (a) Type vegetated earth, uncontrolled, cut through the right abutment and having a bottom width of 30 feet and side slopes of 1V on 3H.
 - (b) Control section A level section near the centerline of the dam.
 - (c) Crest elevation 103.4
 - (d) Upstream Channel Unknown
 - (e) Downstream Channel Parallel with downstream toe of dam.
- j. Regulating Outlets. None

SECTION 2 - ENGINEERING DATA

2.1 DESIGN

Design data were available for this dam from the SCS office in Richmond, Missouri. Copies of the plans and construction notes are included in Appendix C.

2.2 CONSTRUCTION

No construction data were available. It was reported by Mr. Tanner that he started construction of the dam in 1966 and that it was completed by a friend in 1974.

2.3 OPERATION

No data were available on spillway operation. It was reported by Mr. Tanner that the emergency spillway operated once since construction. There was flow through the emergency spillway in the spring of 1975, due to the principal spillway being plugged with ice.

2.4 EVALUATION

- a. Availability. All data in the Richmond SCS office were readily available.
- b. Adequacy. The plans supplied by SCS and the limited visual observations presented herein are considered adequate to support the conclusions of this report. Seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams" were not available, which is considered a deficiency. These seepage and stability analyses should be performed for appropriate loading conditions (including earthquake loads) and made a matter of record.
- c. <u>Validity</u>. All available information and reports on construction control are considered to be valid.

SECTION 3 - VISUAL INSPECTION

3.1 FINDINGS

a. General. A visual inspection of the Tanner Lake Dam was made on July 2, 1980. Engineers from Hoskins-Western-Sonderegger, Inc., Lincoln, Nebraska making the inspection were: R.S. Decker, Geotechnical; Garold Ulmer and Gordon Jamison, Hydrology and Hydraulics. Mr. Oswald Tanner was interviewed prior to inspecting the dam; however, Mr. Tanner was not present during the time of the inspection.

b. Dam.

(1) Geology and Soils (abutment and embankment). Tanner Lake Dam is located in the dissected till plains area within the Central Lowlands Physiographic Region. The dam site is in a region where the stratigraphic sequence consists of loess, 5 to 15 feet thick, overlying Kansan-age glacial drift, of undetermined thickness and character, which in turn overlies bedrock. Bedrock underlies the entire site at an undetermined depth and consists of strata assigned to the Marmaton Group, Demonsian Series, Pennsylvanian System. Strata of this group is comprised of interlayered sequences of shale, sandstone, limestone and thin coal seams.

The upland soil deposits in the dam area consist of soils of the Marshall-Knox soil association. These soils formed on the deep loess deposits that lie adjacent to the Missouri River flood plain. The Marshall soil is positioned on the gently sloping areas while the Knox soil is positioned in the upland valley areas.

Materials in the dam apparently consist of CL and CL-ML soils borrowed from the reservoir area and gully banks (abutments). No glacial till nor bedrock was observed at the site.

- (2) Upstream Slope. The upstream slope is entirely covered with locust trees, brambles and other brush. Vegetation was so dense and thorny that it was not possible to make any accurate measurements or many observations. There did not appear to be any serious erosion along the water line of the dam. One very rough measurement showed the upstream slope to be about 1V on 4H. Photos No. 7, 8, 9 and 14 show the upstream slope.
- (3) Crest. About 85% of the crest is completely covered with locust (thorn) trees and brush, so dense that it was impossible to traverse the crest. One rough measurement showed the crest to be 13 to 14 feet in width. The left end of the crest is open and well vegetated with grass. Materials on the crest were CL-ML soils. Photos No. 2, 3, 4, 7, and 8 show the crest.

- (4) Downstream Slope. The downstream slope is covered with locust trees and other brush. The area along and downstream from the toe to the right of the pipe spillway was quite seepy. Mr. Tanner said he thought this seep was caused by the outlet of an old tile line. The few observations that could be made showed no indications of boils or piping along the toe. It was not possible to determine the physical characteristics of the downstream slope. Photos 4, 5 and 6 show the downstream slope.
- (5) Miscellaneous. The dense cover of locust trees and other brush made it impossible to make many pertinent observations on the condition of this structure.

c. Appurtenant Structures.

- (1) The principal spillway is uncontrolled. It consists of a 20-inch welded steel pipe with a hooded inlet and anti-vortex device. No signs of deterioration were noted in the inlet or outlet of the conduit. Measurements could not be taken to determine whether or not it was constructed according to plans. Photos No. 10, 11 and 12 show the inlet and outlet of the principal spillway. There was no flow through the spillway at the time of inspection. The reservoir level was about 2 feet + below the invert of the principal spillway at the time of inspection.
- (2) Emergency Spillway. According to the plans, the emergency spillway is cut through the right abutment. This area, shown in Photo No. 2, is so densely overgrown with locust trees and brush that it was not possible to recognize the spillway.
- (3) Drawdown Facilities. There are no drawdown facilities for this dam.
- d. Reservoir Area. No significant erosion was observed around the shoreline. The shoreline supports a lush growth of tules and grasses. Photos 9 and 14 show portions of the reservoir. Mr. Tanner reported that there were springs in the reservoir area.
- e. <u>Downstream Channel</u>. The downstream channel is heavily overgrown with trees and brush. Photo No. 13 shows the channel.

3.2 EVALUATION

The very rough measurements that could be made indicate that the dam cross section is equal to or exceeds that shown on the plans. It is not possible to adequately inspect this dam until the trees and brush have been removed. The heavy growth of trees and brush on all surfaces of the dam and in the emergency spillway could cause potential of failure of this dam unless removed.

SECTION 4 - OPERATIONAL PROCEDURES

4.1 PROCEDURES

There are no controlled outlet works for this dam. The pool level is controlled by rainfall, infiltration, evaporation, and the capacity of the uncontrolled spillways.

4.2 MAINTENANCE OF DAM

Due to the heavy overgrowth of locust trees and brushy vegetation on all surfaces of the dam as well as in the emergency spillway it would appear that there has been very little maintenance done since the construction of the dam.

4.3 MAINTENANCE OF OPERATING FACILITIES

No operating facilities exist at this dam.

4.4 DESCRIPTION OF ANY WARNING SYSTEM IN EFFECT

There is no warning system in effect for this dam.

4.5 EVALUATION

The dense overgrowth of trees and brush in the emergency spillway reduces the capacity of the spillway from 20% of the probable maximum flood as shown in Section 5 to an unknown volume of flow. The lack of maintenance could cause potential of failure of this dam.

SECTION 5 - HYDRAULIC/HYDROLOGIC

5.1 EVALUATION OF FEATURES

- a. <u>Design Data</u>. Plans for this dam were obtained from the Soil Conservation Service office in Richmond, Missouri. The plans are included in Appendix C.
- b. Experience Data. The drainage area, reservoir surface area, and elevation-storage data were developed from the USGS Camden, Missouri 15 minute topographic quadrangle map and the SCS plans. The hydraulic computations for the spillway and dam overtopping discharge ratings were based on data from the SCS plans.

c. Visual Observations.

- (1) Heavy tree and vegetative growth made the inspection of the dam almost impossible. Accurate field measurement could not be taken.
- (2) The principal spillway pipe and anti-vortex device appeared to be in good condition.
- (3) The emergency spillway was heavily overgrown with vegetation and trees.
- d. Overtopping Potential. The spillways are too small to pass 50 percent of the probable maximum flood without overtopping. The spillways will pass 20% of the probable maximum flood and the 1% probabilistic flood without overtopping the dam. Overtopping is dangerous because the flow of water over the crest will erode the face of the dam and, if continued long enough, will breach the dam with sudden release of all of the impounded water into the downstream floodplain.

The results of the routings through the dam are tabulated in regards to the following conditions:

Frequency	Inflow Discharge c.f.s.	Outflow Discharge c.f.s.	Maximum Pool Elevation	*Maximum Depth Over Dam-Ft.	Duration Over Top Hours
1/2 PMF	2,330 4,660	1,850 3,720	106.3 106.9	0.9	1 ± 5 +
0.20 PMF	930	290	105.3		

^{*} Minimum Top of Dam Elevation - 105.4

According to the recommended guidelines from the Department of the Army, Office of the Chief of Engineers, this dam is classified as having a high hazard rating and a small size. Therefore, the 1/2 PMF to the PMF is the test for the adequacy of the dam and its spillway.

The estimated damage zone is described in Paragraph 1.2d in this report.

SECTION 6 - STRUCTURAL STABILITY

6.1 EVALUATION OF STRUCTURAL STABILITY

- a. Visual Observation. The few rough measurements and observations that could be made would indicate that the dam should be stable against shear failures. There were no indications of adverse effects of seepage on the stability of the dam. An adequate visual inspection of the dam cannot be made until the dense overgrowth is removed.
- b. Design and Construction Data. Design data and reports on construction are considered adequate to support the conclusions in this report. Seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams" were not available, which is considered a deficiency.
- c. Operating Records. There are no controlled operating facilities for this dam.
- d. <u>Post Construction Changes</u>. The inspection team is not aware of any post-construction changes.
- e. <u>Seismic Stability</u>. This dam is located in Seismic Zone 1. An earthquake of the magnitude predicted in this area is not expected to cause structural failure of this dam.

SECTION 7 - ASSESSMENT/REMEDIAL MEASURES

7.1 DAM ASSESSMENT

- a. Safety. It would appear that this dam does not have a serious potential of failure. Hydrologic analyses presented in this report indicate that the spillways will pass the 1% probability flood and 20 percent of the probable maximum flood without over topping the dam. Clearing trees and brush from the emergency spillway should improve the hydraulic efficiency of the spillway. All trees and brush should be cleared from the structure to facilitate adequate inspection and prevent future impairment of the integrity of the dam. Seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams" were not available, which is considered a deficiency.
- b. Adequacy of Information. The conclusions in this report are based upon data furnished by the Soil Conservation Service, performance history of the dam and the very limited amount of data that could be gathered during the field inspection of the dam. The almost complete overgrowth of both embankments as well as the crest (as shown in the photographs) defied attempts made to conduct profile and cross section surveys. Evidence of cracking, sloughing, settlement, misalignment, erosion or rodent activity normally observed in the field inspection of a dam could not be adequately observed because of the dense overgrowth. Seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams" were not available, which is considered a deficiency.
- c. <u>Urgency</u>. The remedial measures recommended in paragraph 7.2a(3) should be pursued by the owner on a high priority basis.
- d. Necessity for Further Investigations. Further investigations, based on "Recommended Guidelines for Safety Inspection of Dams", should be conducted after the removal of the overgrowth from the embankments and crest of the dam and from the emergency spillway. Remedial measures in addition to those recommended in paragraph 7.2a may become apparent based on these further investigations.
- e. Seismic Stability. This dam is located in Seismic Zone 1. An earthquake of this magnitude is not expected to be hazardous to this dam. It is recommended, however, that the prescribed seismic loading for Seismic Zone 1 be applied in any stability analyses performed for this dam.

7.2 REMEDIAL MEASURES

The following remedial measures and maintenance procedures are recommended. All remedial measures should be performed under the guidance of a registered professional engineer experienced in the design and construction of earth dams.

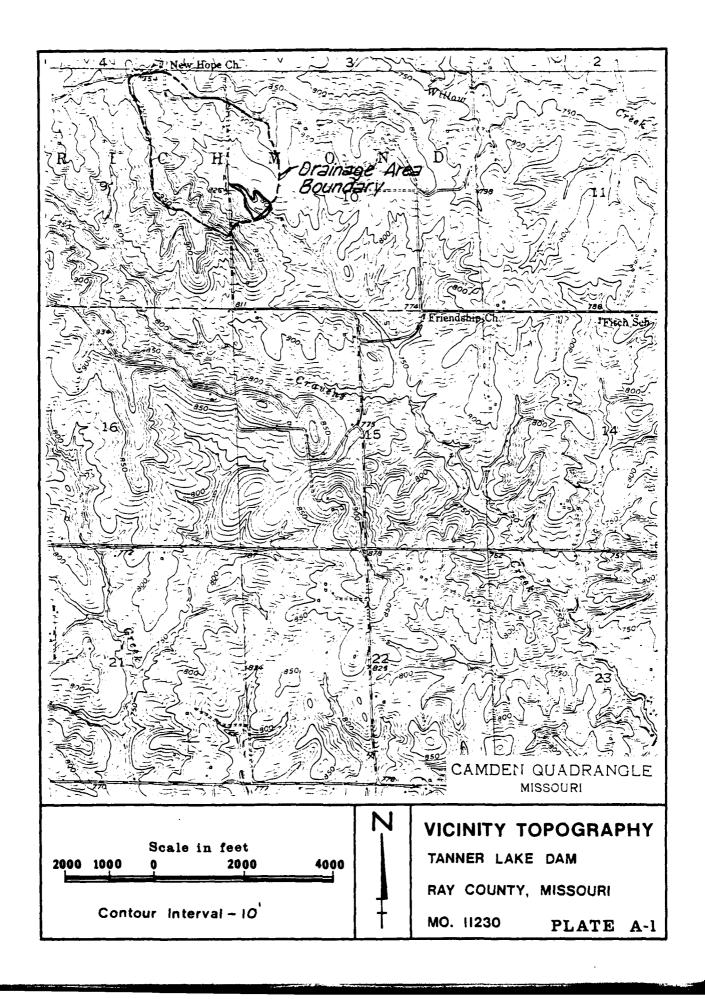

a. Alternatives.

- (1) All trees and brush should be removed from the embankments and crest of the dam and from the emergency spillway.
- (2) Following the removal of trees and brush from the dam and the emergency spillway another inspection based on the "Recommended Guidelines for Safety Inspection of Dams" should be made. Remedial measures that may become apparent, based on this inspection, and which are not covered in this paragraph should be incorporated in the work to be done by the professional engineer.
- (3) The spillway size and/or the height of the dam should be increased in order to pass 50 percent of the probable maximum flood without overtopping the dam. Spillway capacity could be increased either by enlarging the existing emergency spillway or by construction of an additional spillway through the left abutment.

b. Operation and Maintenance Procedures.

- Seepage and stability analyses comparable to the requirements of the recommended guidelines should be performed by an engineer experienced in the design and construction of dams.
- (2) After the remedial measures recommended in paragraph 7.2a are accomplished a program of periodic inspection and regular maintenance should be initiated in order to control tree and brush growth and to make minor repairs.
- (3) Records of inspections should be made a part of this project file.

APPENDIX C PROJECT PLATES

APPENDIX D HYDRAULIC AND HYDROLOGIC DATA

HYDROLOGIC COMPUTATIONS

- The SCS dimensionless unit hydrograph and the systemized computer program HEC-1 (Dam Safety Version), July 1978, prepared by the Hydrologic Engineering Center, U.S. Corps of Engineers, Davis, California, were used to develop the inflow hydrographs (See this Appendix).
 - a. Twenty-four hour, one percent probabilistic rainfall for the dam location was taken from the data for the rainfall station at Sweet Springs, MO. as supplied by the St. Louis District, Corps of Engineers per their letter date 4 March 1980. The twenty-four probable maximum precipitation was taken from the curves of Hydrometeorological Report No. 33 and current Corps of Engineers and St. Louis policy and guidance for hydraulics and hydrology.
 - b. Drainage area 0.258 square miles (165 acres).
 - c. Time of concentration of runoff = 18 minutes (computed from the "Kirpich" method and verified using the SCS "Upland" method).
 - d. The antecedent storm conditions for the probable maximum precipitation were heavy rainfall and low temperatures which occurred on the previous 5 days (SCS AMC III). The antecedent storm conditions for the one percent probabilistic precipitation were an average of the conditions which have preceded the occurrence of the maximum annual flood on numerous watersheds (SCS AMC II). The initial pool elevation was assumed at the invert of the principal spillway.
 - e. The total twenty-four hour storm duration losses for the one percent probabilistic storm were 2.91 inches. The total losses for the PMF storm were 1.58 inches. These data are based on SCS runoff curve No. 88 and No. 75 for antecedent moisture conditions SCS AMC III and AMC II respectively. The watershed is composed of SCS hydrologic soil groups B, C and D. Approximately 45 percent of the watershed consists of B soils (Knox, Sharpsburg, Kennebec and Sibley soils); 36 percent consist of C soils (Greenton soils); and 19 percent consist of D soils (Snead soils). The D soils contain primarily woods with some area in pasture. The C soils contain primarily pasture with some small grain. The B soils have both small grain and legumes being produced with contour farming being practiced.
 - f. Average soil loss rates = 0.06 inch per hour approximately (for PMF storm, AMC III).
- 2. The combined discharge rating consisted of three components: the flow through the principal spillway, the flow through the emergency spillway, and the flow going over the top of the dam.

- a. The principal spillway rating was developed using the methods described in "Hood Inlets for Culvert Spillways", Technical Release No. 3, Design Section, June 27, 1956, USDA-SCS. The rating consisted of weir flow, slug flow, and full pipe flow. Full flow controls at or above pool elevation 102.7 feet.
 - 1) Weir flow was developed from Table No. 1 of the above referenced article.
 - 2qH 1+Ke+Km+KpL 2) Full flow equation - Q = a

where $a = area of pipe, ft.^2 = 2.18$

Ke = entrance loss coefficient = 0

Km = bend loss coefficient = 0

Kp = pipe-friction loss coefficient = 0.01349

L = length of pipe, ft., = 98 ft.

- b. The emergency spillway rating was developed using the Corps of Engineers, Water Surface Profile HEC-2 computer program assuming critical depth downstream of the centerline of the dam.
- c. The flows over the dam were determined by using the dam overtopping analyses within the HEC-1 (Dam Safety Version) program.
- Floods were routed through the reservoir using the HEC-1 (Dam Safety Version) program to determine the capabilities of the spillway and dam embankment crest. The input, output and plotted hydrographs are attached in this Appendix.
